

LARGE FILE TRANSFER

Sending large files securely (such as images, videos or print files) is particularly challenging, since they are often too large for conventional email. SEPPmail's unique and patented GINA technology is the elegant solution for the secure and easy sending of heavyweight files. For this purpose, SEPPmail's Large File Transfer (LFT) module is available, which allows you to send files of any size to e-mail recipients. The sender either works in their usual environment (e-mail client) or uses the GINA interface.

At the other end, the recipient uses the GINA interface and thus accesses their data intuitively and without any need for assistance.

THE HIGHLIGHTS AT A GLANCE

- Easy sending of oversized files based on GINA technology
- Data is encrypted and is not cached in the cloud
- No further registration and transfer process for users
- Bi-directional exchange of several files with choice of adding comments alongside
- Handling simplified through Outlook plug-in
- Upon request, external access can be password-protected
- LFT has been checked by PCI experts and classified as "compliant"
- Optional: Connection of external storage capacities via CIFS/NFS or through a cluster license
