

## E-MAIL COMMUNICATION ON THE SAFE CLOUD - WITH BUILT-IN ANTI-SPAM AND VIRUS PROTECTION

### SEPPMAIL.CLOUD

0837 is not the area code of a neighbouring country of Kazakhstan - but the SEPPmail success combination for your data vault above the clouds.

Zero effort, for the power of eight, on three pillars - with the smartness of the glorious seven.

## ZERO EFFORT - MAXIMUM PERFORMANCE

From now on, our secure e-mail gateway with all its tried and tested functions is floating weightlessly on cloud nine. Email encryption, email signature or large file transfer as an immediately usable cloud solution - all the way. Without on-site installation, with the same safety and simplicity. Always up to date.

**Cost-efficient, reliable and future-oriented - under one roof**

We operate cost-efficiently and reliably from data centres in Switzerland and Germany - according to current data protection standards, such as the DSGVO. This includes audit and compliance reporting for those responsible for security - excluding delayed or lost emails. Operable via a common management dashboard - complete email security under a single roof.

With an integrated anti-spam and virus protection programme.

## THE POWER OF EIGHT

These eight services make your email traffic a force in cyber space:

### ENCRYPTION OF DATA TRAFFIC - STANDARD FOR PROFESSIONAL E-MAIL COMMUNICATION.

The spying on e-mail data by third parties is prevented via S/MIME and openPGP technologies - also based on the managed SEPPmail Domain Encryption (communication with up to 10,000 participating domains).

### AUTOMATIC UPDATE OF VIRUS FILTER SIGNATURE

In addition to commercial virus filter signatures, we also use specialised ones. They are constantly updated to detect the latest viruses specialising in email.

### BACKSCATTER MAIL MINIMISATION

We filter and minimise „delivery status notifications“, which are also misused for manipulation, down to the „real“ ones.

### DYNAMIC MULTI-LEVEL SPAM DETECTION

Several actively defined filter levels ensure that the correct mails are separated from the incorrect ones - and that you only get the correct ones.

### LINK TRACKING & BLOCKING

We use a URL block list to scan incoming and outgoing mail for harmful URLs and - simply - block them.

### PHISHING FILTER AGAINST DRIVE-BY DOWNLOADS

Phishing filters ensure that, among other things, reloadable malicious script commands (enabling problematic drive-by downloads) are detected and eliminated.

### OUTBOUND FILTERING

Outgoing e-mails are also checked for spam and viruses to prevent you from unintentionally sending malware and spam e-mails.

### SPAM TRAP DOMAINS - HONEYPOTS FOR VIRUSES

Over a hundred spamtrap domains (a kind of honeypot for intruders) detect new viruses or spam and render unusual attachments inoperable.

## EARTHQUAKE-PROOF ON THREE COMPLIANCE PILLARS

### AUDIT LOGS

Logins and changes in the control panel are logged indelibly and visible to administrators.

### 1000+ CONTENT FILTER RULES

Our content filters comprise 1000+ rules, whereby we adopt the order of magnitude from the customer's mail server. We can selectively filter for office macros and implement rate limiting.

### STANDARDISED SLA FOR AVAILABILITY AND FILTER PERFORMANCE

The „Service Level Agreement“ (SLA) describes the performance characteristics and scope. Such as filter performance and service availability.

## SMARTNESS OF THE MAGNIFICENT SEVEN

### MIGRATION AND INTEGRATION WITHOUT EFFORT

Individually adjust the domain and basic settings, pan the MX records - and you're done. Our system is fully usable within a few minutes.

### QUARANTINE REPORT IN CONFIGURABLE INTERVALS

Users can customise the delivery of their quarantine report to suit their way of working and set it to specific times.

### SELF SERVICE

You can order additional services such as encryption on the portal on an ongoing basis.

### ONE-CLICK-RELEASE

E-mails in the quarantine can be delivered from the spam report with a simple mouse click.

### QUARANTINE REPORT IN CONFIGURABLE INTERVALS

Users can customise the delivery of their quarantine report to suit their way of working and set it to specific times.

### RELIEVING THE LOAD ON THE MAIL SERVER

„Spam and Malware Protection“ only lets valid messages pass, which significantly increases the performance of the customer's mail server. The integrated virus filter makes an additional protection system superfluous.

### SECURING THE DESIRED E-MAIL TRAFFIC - PROACTIVE INFORMATION IN CASE OF A STAGNANT MAIL FLOW

Should the mails ever get stuck in a queue, we inform our customers proactively.
